

Message sent to Planet 'Earth' that could host life

A couple of lightyears ago, the Ministry of Alienation sent a message to a new discovered planet called 'Earth'. They also tried to make contact with the inhabitants. They took this creature, a so called Homo Sapien, for an interrogation. We brought him in a trance, took his DNA and asked him some questions for further investigations. We can assume that this Homo Sapien population will not cause any problems. They are weak and very influenceable.

Team members from the Alienation crafted a message that includes a scientific and mathematical tutorial, as well as 33 short musical compositions. The team beamed this message out in binary code at two different radio frequencies. Some have suggested that such a message would have to be "decontaminated" before they actually read it, to ensure that the danger was understood and removed before people came to read it. But the paper titled "Interstellar communication. IX Message decontamination is impossible" suggests that it would be practically impossible to remove that danger.

A radar system that could get adequate information from a single pulse was not the work of amateurs. It was the product of a very highly developed technology. The radar told us that there's nothing new within three-quarter million miles. The Alienation will make a computer virus that infect networks on Earth when it was decrypted, or an artificial intelligence that would then be able to take over their computing systems. More details will be revealed soon.
